

SIM2K

Adapting Technology to Your Business Needs

SIM2K[®] TrakIT

Asset Tracking and Management

SIM2K[®] TrakIT offers the ability to scan your network and categorize the hardware and software you have installed. This produces an immediate inventory list that you can use for your records. This is also important for insurance purposes as it provides a detailed inventory should there ever be a claim.

SIM2K TrakIT is also important from the standpoint of managing your IT assets. This way you will know the age of your hardware, what software and version of that software is installed on the hardware, as well as the makes and models of printers and other peripherals on your network. This way you can see which users have what equipment, whether their software is up-to-date as well as what that device is called as part of your network. This way you can ensure you are compliant with software licenses should there ever be a question, or know who has the older machines that may be candidates for upgrades or replacements.

SIM2K TrakIT also helps SIM2K with managing and maintaining your network, as we use this information to document your company and understand these same issues – age of hardware, installed software and device names on the network. This way we can more readily assist you, knowing what type of device it is that needs attention and what to expect to find on it when our Network Technician begins to assess the problem.

SIM2K TrakIT is available as part of our SIM2K Serenity comprehensive support package, or for those companies looking for a quick and easy means to inventory their IT network. Call SIM2K for more information on TrakIT and all our SIM2K support programs.
